Smart Lighting for Parking Lots & Parks

A self-contained lighting control system – one small base station, up to 25 lights.

WHO IT IS FOR

Supermarkets, warehouse clubs, restaurant chains, shopping centers, HOAs and private parks.

THE PROBLEM

Parking lot lights burn all night at full power, failures go unnoticed for weeks, and every site is managed differently.

WHAT YOU GET

1. **Plug in, done**
   Wireless controllers in the standard photocell socket connect to a small base station on site – no cabling between poles.
2. **Works without internet**
   Schedules, dimming and alerts run locally on the base station. Remote access is optional.
3. **Save energy after hours**
   Full brightness while the store is open, dimmed after closing – automatically, every night.
4. **Fewer dark spots**
   Failed lights are reported immediately, so they are fixed before customers notice.
5. **Built for chains**
   Identical setup for every location: once one site runs, the next one is a copy.

> **Why Apollo Innovation?** Simple to install, simple to operate, and designed for many identical sites. Now accepting pilot locations.

COMMON QUESTIONS

What if a site is larger than 25 lights?
Add a second base station – sites can be combined in one overview.

Do we need an IT department?
No. We deliver the base station preconfigured.
